Work

Head backend developer @ Hubstr.app

Nov 2020 — Jul 2023

I worked at this company for over 3 years, during which I had three very dynamic years. Throughout this time, I was deeply engaged in the development of the "Hubstr" project. In brief, Hubstr is a platform for creating small-scale social networks tailored for exclusive communities. The project emphasizes highly customizable features and seamless integration with external services. Throughout the project's lifecycle, we executed a multitude of intriguing technical solutions, reflecting the project's versatile nature and innovative potential.

Head backend developer @ Vermillion Synergy (UAE)

Nov 2016 — Nov 2020

During my time at this company, I have successfully completed numerous projects and acquired a wealth of new knowledge. Among our achievements was the development of a delivery system for food and groceries in Dubai. We designed survey systems for potential users, incorporating complex business analytics. We even developed a proprietary framework for creating and managing such processes. Additionally, we implemented a system that integrated television and radio broadcasts in Turkmenistan with local mobile operators. I led the implementation of an online SMS voting system and SMS-based television quizzes. A notable challenge in this project was the inability to access servers remotely in the country. This meant that all updates and maintenance required physical travel to Ashgabat. Consequently, the system's reliability and performance were of paramount importance. I'm particularly proud to share that during our support tenure, we experienced zero downtime, a testament to the robustness of our solution.
